Research Interests and Future Plans

Ke-Cheng Hsu (Clio)
Ph.D. Candidate in Economics, The Hong Kong University of Science and Technology
khsu@connect.ust.hk

Prepared for the Assistant Research Fellow search, Chung-Hua Institution for Economic Research.

I am an empirical industrial organization researcher. My agenda is digital platforms and the design of marketplace rules, and the translation of those rules into economic policy analysis. A platform chooses the refund menu, the fee, and the constraints on price. Each choice changes who buys, who returns, how sellers price, and who bears the cost. I estimate structural models, in Python, R, and C++, that rank such rules by welfare. The written ranking, with the instrument, the trade-off, and the limit of the evidence, is the policy analysis I would do at CIER. I expect to complete the Ph.D. in June 2027.

My job-market paper, "Designing Return Policy in E-Commerce: A Trade-off between Purchase and Return Efficiency," treats return-shipping insurance as a marketplace rule on Taobao. A women's apparel retailer switched between automatic coverage, paid by the seller, and optional coverage, bought by the buyer. A stricter rule cuts wasteful returns. The lower return rate then makes a higher price more attractive, and that price can shut out purchases that would have been worth making. I estimate purchase, insurance take-up, and returns under the seller's monopoly pricing by the generalized method of moments, across six apparel categories. Automatic coverage does better where margins and salvage value are high, because it brings in valuable purchases. Optional coverage does better where margins are thin, by about 15 to 30 percentage points of first-best welfare, and by about 50 percentage points in the thinnest category. A counterfactual menu, a discounted price plus a 10 to 15 percent restocking fee, beats both rules in most categories. The menu is a policy instrument: it trades participation against wasteful returns, and it changes the price the seller sets.

Two further projects ask the same style of policy question. With Ce Bian and Liang Zhao, I study pass-through when buyers can return the good. A platform commission or a sales tax can lower the equilibrium price: the fee raises returns, thins the seller's effective margin, and can reduce the surplus lost to those returns. An incidence calculation that treats the sale as final can therefore get the sign of the policy wrong. With Kohei Kawaguchi and Kei Kawai, I study Japanese book retail under resale price maintenance. The retail price is fixed before demand is known, which supports inventory in low-demand states, and unsold copies are returned and discarded. Ignoring inventory and uncertain demand overstates marginal cost by about 20 percent and misstates the environmental cost of the commitment. We ask how much of the waste the commitment creates, and whether a deposit-refund tax can reduce it.

My M.Phil. thesis with Pak Hung Au studies product design when search costs differ across consumers. Those costs sort buyers toward niche or standardized products, and a fall in search costs can raise prices when the sorting dominates the usual effect of easier search. Platform search design moves this margin. Earlier, as a research assistant at National Taiwan University, I modeled a bank crisis on an interbank lending network and asked when a regulator's no-bailout threat is credible.

At CIER I would turn these rankings into written policy analysis for digital markets. Three directions follow from the papers above.

Platform return, refund, and fee rules. I would move from one seller's insurance menu to rules a marketplace can set across sellers: who is covered, who pays the cost of a return, and how a restocking fee changes who participates and how much is returned. The welfare object is the same trade-off as in the job-market paper, stated as platform policy.

Platform fees and taxes when a purchase can be reversed. Building on the work with Bian and Zhao, I would rank commission schedules and sales taxes when returns feed back into price, and state when a standard tax analysis misstates who pays.

Pricing commitments and waste. Building on the work with Kawaguchi and Kawai, I would compare the inventory benefit of a price that cannot adjust with the unsold stock and environmental cost it creates, including for rules that fix prices or limit discounting.

Where a question concerns a merger or firm conduct in a digital market, I can draw on Ph.D. coursework in merger simulation, entry and exit counterfactuals, and conduct identification, and I would label that work as coursework until it is estimated on the market at issue.

CIER's specialty is economic policy analysis. I would write each ranking as a policy note: the marketplace rule, who buys and who returns, how the price moves, and what evidence would reverse the conclusion.

List of works

- "Designing Return Policy in E-Commerce: A Trade-off between Purchase and Return Efficiency." Job-market paper. Presented at the Asia-Pacific Industrial Organization Conference 2026, the Econometric Society Australasia Meeting 2026, and the China Economics Annual Conference Summer Forum 2026.
- "Too Much Unsold Stock?: Environmental Consequences of Price Commitment," with Kohei Kawaguchi and Kei Kawai. Work in progress.
- "Pass-Through and Incidence with Product Returns," with Ce Bian and Liang Zhao. Work in progress.
- "Product Design with Heterogeneous Search Costs," M.Phil. thesis, with Pak Hung Au. Presented at the Asia-Pacific Industrial Organization Conference 2023 and the Asian Meeting of the Econometric Society 2023.
